## Progress Update

# William Shields 

(william.shields@rhul.ac.uk)

WP6 Meeting

28 ${ }^{\text {th }}$ February 2023

## General Update

- No progress on solenoid optimisation
- Other commitments
- Solenoid focus discrepancy due to suspected user error - apologies!
- Assembling \& tabulating data for 6 month report
- Beam parameters
- Nozzle transmission
- Lattice geometry changes
- Solenoid strengths (nominal \& optimised - all configurations)
- Gabor Lens strengths (nominal \& optimised - all configurations)
- Collimator settings
- ...
- Overleaf document?

## Nozzle Transmission

ROYAL
HOLLOWAY HOLLOWAY UNIVERS

- Beam after 5 cm (unsure which code used to simulate $0-5 \mathrm{~cm}$ )
- Down-sample \& apply energy cut ( $\pm 2 \%, \pm 5 \%$ )
- $2 m m$ radial cut - nozzle entrance aperture
- Propagate in GPT for 5 cm
- Apply 2.87mm radial cut - nozzle exit aperture

| Beam Energy (MeV) | Particle Numbers at <br> nozzle entrance <br> (with 2.00 mm cut) | Particle Numbers at <br> nozzle exit <br> (with 2.87 mm cut) | Transmission (\%) |
| :---: | :---: | :---: | :---: |
| $15 \pm 2 \%$ | 35574 | 27321 | 76.80 |
| $15 \pm 5 \%$ | 88610 | 68038 | 76.78 |

- Minimal impact on spectrum
- Momentum cleaning collimator in vertical arc generates $\pm 2 \%$ target
- Further down-sample beams to 10k particles for computational efficiency

## Beam Parameters

- Tabulating beam parameters for 6 month progress report:
- RMS emittance

| Beam Energy <br> $(M e V)$ | $E_{x}(m \mathrm{rad})$ | $E_{y}(m \mathrm{rad})$ | $\beta_{x}(m)$ | $\beta_{y}(m)$ | $\alpha_{x}$ | $\alpha_{y}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $15 \pm 2 \%$ | $1.25 \mathrm{e}-7$ | $1.24 \mathrm{e}-7$ | 12.71 | 13.13 | -128.70 | -132.84 |
| $15 \pm 5 \%$ | $2.43 \mathrm{e}-7$ | $2.42 \mathrm{e}-7$ | 6.61 | 6.70 | -66.73 | -67.58 |

- Nominal parameters from Jaroslaw ( $15 \mathrm{MeV} \pm 2 \%$ ):
- RMS physical emittance 1.26*10^-7 m
- Beta 12.82 m
- Alpha -129.79
- Beam will be $15 \mathrm{MeV} \pm \sim 5 \%$ at the start of the FFA injection line
- Momentum cleaning required in FFA injection line or FFA acceptance OK at $\pm 5 \%$ ?

## Emittance Growth

- Emittance changes significantly within the first solenoid
- 3 cm spot size configuration
- Spike between GL1 \& GL2 due to finite solenoid fields
- Two independent emittance calculations:
- GPT analysis program (gdfa)
- BDSIM analysis program (rebdsimOptics)

## Emittance At Arc Entrance

| Beam Energy <br> $(\mathrm{MeV})$ | Nominal $\mathrm{E}_{\mathrm{x}}$ <br> $(\mathrm{m} \mathrm{rad})$ | Nominal $\mathrm{E}_{\mathrm{y}}$ <br> $(\mathrm{m} \mathrm{rad})$ | Simulated $\mathrm{E}_{x}$ <br> $(\mathrm{~m} \mathrm{rad})$ | Simulated $\mathrm{E}_{\mathrm{y}}$ <br> $(\mathrm{m} \mathrm{rad})$ |
| :---: | :---: | :---: | :---: | :---: |
| $15 \pm 2 \%$ | $1.25 \mathrm{e}-7$ | $1.24 \mathrm{e}-7$ | $3.64 \mathrm{e}-6$ | $3.52 \mathrm{e}-6$ |
| $15 \pm 5 \%$ | $2.43 \mathrm{e}-7$ | $2.42 \mathrm{e}-7$ | $7.72 \mathrm{e}-6$ | $7.71 \mathrm{e}-6$ |

- Horizontal beam size ( 1 sigma radius) for $\beta=50 \mathrm{~m}$ :

| Beam Energy (MeV) | Nominal $\mathrm{E}_{x}$ | Simulated $\mathrm{E}_{\mathrm{x}}$ |
| :---: | :---: | :---: |
| $15 \pm 2 \%$ | 2.5 mm | 13.5 mm |
| $15 \pm 5 \%$ | 3.5 mm | 19.7 mm |

- Impact on FFA \& injection line?
- Re-optimisation needed for parallel beam
- Provision of small spot sizes still important
- Beam transport flexibility
- Revisit 5 Gabor Lens model
- Suspect $\beta=50 \mathrm{~m}$ is met/achievable. Flexibility remains an issue.

## Summary

- Done:
- Begun assembling \& tabulating crucial data for 6 month report
- Ongoing:
- Find solutions for smaller beam sizes
- Update models of alternative baseline design (v5.5)
- Todo:
- Find new solution for for $\beta=50 \mathrm{~m}$
- Determine nominal octupole settings
- Quads only model (v6.0)
- Develop OPAL model of FFA - need JP input.
